

Integrated Retrofit Solutions

Delivered in partnership with:

Trade Engine have provided a cloud-based QMS platform to the Energy Efficiency and Retrofit sectors since 2014. This also underpins our own Project Management activities in ECO.

Our platform has been extended to enable the delivery of PAS 2035 compliant measures.

Information captured at Retrofit Assessment can be processed and analysed, leading to the creation of a Retrofit Design, Low Carbon Plan and Improvement Option Evaluation.

Central to our solution is the appointment of an in-house Retrofit Coordinator, who can be instructed via our platform and will assist the specification of measure packages based upon a project's risk profile. Our team have significant site-based experience across all measures.

We have collaborated with **Stroma Certification** to enable seamless project sign-offs and lodgement of measure packages in the TrustMark data warehouse.

Please speak to a member of our team for further details or to schedule a demonstration.
